

**We've Known Since 2020:
COVID-19 Vaccines Don't Stop the Spread of COVID-19**
Pamela A. Popper, President
Wellness Forum Health

Last week a Pfizer employee admitted in front of the European Parliament that the company did not know if its vaccine would stop infection or the spread of COVID-19 before the vaccine was introduced to the market. A video of the exchange between Janine Small and Parliament member Bob Roos, went viral.

Parliament member Bob Roos asked Small, "Was the Pfizer COVID vaccine tested on stopping the transmission of the virus before it entered the market? Did we know about stopping immunization before it entered the market?"

Small, president of international markets for Pfizer, said in response: "No ... You know, we had to ... really move at the speed of science to know what is taking place in the market."¹ Who knows what this means? Jiberish seems to be the default language for the criminals in charge when they are under pressure.

Roos responded by saying that "Millions of people worldwide felt forced to get vaccinated because of the myth that 'you do it for others.' Now this turned out to be a cheap lie and should be exposed."²

This episode in medical history is much more consequential than "a cheap lie." The justification for the draconian vaccine passports was that vaccination would stop the spread. Unvaccinated people were prevented from eating out, attending theatrical performances, and in some places, even shopping for groceries. Children were prevented from playing sports if they were not vaccinated. Students were forced to drop out of college because of vaccine mandates; some due to vaccine injury.³ Family members often found themselves at war with one another, and unvaccinated family members were disinvited to events like baptisms and weddings. And millions of people, many of them healthcare workers, lost their jobs.

But it was well-known at the time that the vaccines were introduced that they were likely ineffective for stopping infection with or transmission of COVID-19. I wrote about this in my newsletter dated April 12 2021, and referenced data which was posted by health authorities in 2020. Following are excerpts from that article:

The Centers for Disease Control enthusiastically encourages people to get a COVID-19 vaccine. A CDC website features these statements:

"All COVID-19 vaccines currently available in the United States have been shown to be highly effective at preventing COVID-19."

"Getting vaccinated yourself may also protect people around you."

“Clinical trials of all vaccines must first show they are safe and effective before any vaccine can be authorized or approved for use, including COVID-19 vaccines. The known and potential benefits of a COVID-19 vaccine must outweigh the known and potential risks of the vaccine for use under what is known as an Emergency Use Authorization (EUA)”⁴

But these statements are false. An FDA briefing document dated December 17 2020 includes the following statements concerning the Pfizer vaccination:⁵

“Data are limited to assess the effect of the vaccine against asymptomatic infection.”

“Data are limited to assess the effect of the vaccine against transmission of SARS-CoV-2 (virus) from individuals who are infected despite vaccination.”

Concerning the Moderna vaccine, another FDA briefing document also dated December 17 2020 reports the same limitations, and describes plans for a trial to measure infection prevention which will be completed by December 31, 2023.⁶

The FDA’s documents for the J&J vaccine, dated December 17 2020 report basically the same thing. The vaccine does not prevent infection or transmission of SARS-CoV-2.⁷

The CDC Advisory Committee that recommended the EUA for Moderna, posted on December 20 2020 stated, “the level of uncertainty for the benefits of the Moderna COVID-19 vaccine was...type 4 (very low certainty) for the estimates of prevention of asymptomatic SARS-CoV-2 infection and all-cause death.”⁸

CDC guidance for vaccine administrators features this question and answer: *Can a person who has received a Covid-19 vaccine still spread COVID-19? **At this time, we do not know if COVID-19 vaccination will have any effect on preventing transmission.***⁹

The World Health Organization concurs: *We do not know whether the vaccines will prevent infection and protect against onward transmission.*¹⁰

In spite of all of this, the pressure was intense to get a vaccine that everyone knew was useless. In May 2021 Anthony Fauci said in a CBS interview, “When you get vaccinated, you not only protect your own health and that of the family but also you contribute to the community health by preventing the spread of the virus throughout the community.”¹¹ President Biden told Americans in July 2021 that “you’re not going to get COVID if you have these vaccinations.”¹²

The FDA, the CDC, and WHO knew the vaccines were useless. The vaccine makers had to know this; the data in FDA, CDC, and WHO documents was provided by them. I

knew and wrote about this in early 2021. So-called experts like Fauci also had to know – they either knew and lied about it or they are remarkably incompetent. Either way, they need to pay for the extraordinary damage that they caused.
